						Watch for the night sky changing. Where I live, Orion spends most of the winter in the east sky. Now, he is in the south sky.
		The days are noticeably longer now. Up in the north, the longer days are notable as soon as the new year, but especially noticeable now. I hear that in the south this change is not nearly so prominent. What is it like where you live?				
				All the creatures that hide during the winter are reemerging. This includes chipmunks, amphibians, and worms. How do you when the worms are out? When the birds return that eat them, like robins. Alternatively, flipping over rocks works well.		
	Look for spring wildflowers! Down south, these are probably already all blooming and this is old news, but up north these flowers are just starting to come out. They are early this year.				Earth Day!	
			Watch for the fruit trees to bloom. They might bloom soon. Hopefully they won't get caught in a cold snap. That would be catastrophic to the apple crop.
